Live app	https://nevin-chatbot-ai-math-learning-assistant.ai.studio/
Date	13 September 2026

Final checkpoint focus

Refine prompts and deployed model settings; verify multi-turn context; test the public demo; complete GitHub materials; record an explainer video; and publish the Day 7 LinkedIn checkpoint.

Evidence already available

Prior project documentation records a working Gemini application in Google AI Studio, a GitHub Pages project site, a public repository, Day 6 security/performance refinements, and 44/44 automated local checks. Live-provider accuracy/latency evidence was intentionally left pending.

Before marking Day 7 complete

- Run the live test matrix and record actual results.
- Record actual temperature/token settings if exposed by the deployment.
- Verify demo, GitHub Pages, and repository from a private/incognito browser.
- Perform final secret/privacy review.
- Record and publish the 3-5 minute explainer video and add its URL.
- Publish the LinkedIn post and save its URL/evidence.

Explainer video structure

0:00-0:25 - Introduction

Hello, I am Nevin, and this is my Day 7 checkpoint for the Building Agentic AI Challenge. My project is Nevin Chatbot, an AI Math Learning Assistant designed to make mathematical learning more accessible, engaging, and personalized.

0:25-0:55 - Problem and solution

Students often need more than a final answer: they need clear steps, explanations, verification, and a way to ask follow-up questions. Nevin Chatbot provides an interactive AI-assisted learning experience focused on mathematics.

0:55-1:35 - Architecture and backend

The public project is organized in GitHub, with a project page on GitHub Pages and the live Gemini-powered application in Google AI Studio. Explain the actual files/components visible in your repository and how user input reaches the model. Do not claim a vector database unless you actually added one.

1:35-2:25 - Live demo

Open the public demo. Ask a representative math question, show the structured response, then ask a follow-up that depends on the previous turn. Briefly demonstrate how an ambiguous or incomplete prompt is handled.

2:25-3:05 - Reliability and security

Explain the Day 6 refinements: prompt-injection defenses, privacy/secret checks, constrained mathematics tools, history/token limits, timeout/retry behavior, caching, duplicate-submit protection, and friendly user feedback.

3:05-3:35 - Testing

Show the Day 7 workbook/test log. State only the results you actually recorded. Mention that local automated checks and live-provider measurements are different evidence types.

3:35-4:10 - GitHub and documentation

Show the public repository, README, security documentation, progress workbook, report, and project links. Explain that the repository brings the challenge materials together in one place.

4:10-4:35 - Reflection and close

The main lesson from this challenge is that a useful AI application is not only about generating an answer. It also needs reliable prompts, safe handling, good user experience, testing, documentation, and clear communication. Thank you for watching my Day 7 checkpoint.

LinkedIn post

■ Day 7 Complete - Building Agentic AI Challenge!

I have reached the Day 7 checkpoint with Nevin Chatbot, my AI Math Learning Assistant. This final stage brought together the technical refinement, testing, documentation, deployment, and communication work from across the challenge.

For Day 7, I focused on refining LLM interactions, reviewing prompt and model settings, testing multi-turn and edge-case behavior, verifying the public user experience, organizing the final GitHub materials, and preparing an explainer video of the project.

One of my biggest takeaways is that building an AI application is not just about getting a model to generate an answer. A strong application also needs thoughtful prompt design, context handling, security, error handling, testing, a smooth user experience, and clear documentation.

■ Project: Nevin Chatbot - AI Math Learning Assistant

- GitHub: <https://github.com/Nevin-CS/nevin-chatbot-ai-math-learning-assistant>
- Project page: <https://nevin-cs.github.io/nevin-chatbot-ai-math-learning-assistant/>
- Live app: <https://nevin-chatbot-ai-math-learning-assistant.ai.studio/>
- Explainer video: [ADD FINAL VIDEO LINK]

Completing Day 7 is an important milestone, but it is also a starting point for continuing to improve the assistant, evaluate it with real users, and explore stronger context and retrieval techniques in future versions.
